

Sprint meeting 9

Meeting date: 13th February 2026

Supervisor: Haoyi Wang

Meeting time : 15 minutes

Progress:

- Expanded rating system, not complete but now rates Usage of roads, environmental effects, number of shops, NPCs that are homeless, amount of medical facilities, number of entertainment venues and power usage compared to generation
- Added 2 power station buildings, one a wind farm and one a coal power plant
- Added a base for an energy system, each building has an energy usage which will be deducted from the total energy reserves over time. Likewise power plants will generate this
- Added new classes for power plants that inherits from building
- Fixed rating info display system. Now info will always be available to view based on what is affecting the cities rating
- Reworked the in game UI adding an info bar and a section to display the current power level
- Added a shopping centre building, acting as the first entertainment venue.
- Reworked main menu UI-now has save slots, delete save button, improved save file creation page(including save file naming and game mode selection)
- Reworked data base and improved save functionality. DB now properly stores tile positions, Number of NPCs in the city, Building types and their positions.
- Reworked set up code, now when loading from a save file the data will be used to set up the city
- Added dynamic roads, they now change and connect to roads placed around them
- Added background music for in game
- Fixed building issue when an NPC would not react to the building being removed
- Various bug fixes across the project (fixed issue with removing buildings that came up last week + more)
- Expanded NPC behaviour and systems . They now make decisions based on how tired, sick and bored they are, all of which are accounted for when an npc makes a new decision
- Added NPC growth, at certain intervals, a random check will be done to see if a new npc will move to the city. This chance increases the higher the city rating is

Suggestions/questions from supervisor

- Power plants should have a coverage range, with further away buildings not benefitting
- Is there a cap on how much energy you can have?
- Questions about the rating system

Going forward

- Next sprint will be very gameplay focused
- Money system will properly be implemented
- Proper distinction between game modes
- Cap will be added to prevent infinite energy generation - potentially with buildings to expand cap
- Rebalancing of power usage
- Transport mechanics will be properly implemented
- Add chance for npcs to leave if happiness is low
- Graphic overhaul sometime in future
